# Abstract

In biology, **localisation is function** - understanding the sub-cellular localisation of proteins is paramount to comprehend the context of their functions. Mass spectrometry-based **spatial proteomics** and contemporary **machine learning** enable to build proteome-wide spatial maps, informing us on the location of thousands of proteins. Nevertheless, while some proteins can be found in a single location within a cell, up to half of proteins may reside in multiple locations, can dynamically re-localise, or reside within an unknown functional compartment, leading to considerable **uncertainty** in associating a protein to their sub-cellular location. Recent advances enable us to **probabilistically** model protein localisation as well as quantify the uncertainty in the location assignments, thus leading to better and more trustworthy biological interpretation of the data.

1. **Use case:** spatial proteomics.
2. Novel **computational biology research and developments** to acquire reliable biological knowledge.
3. **Behind the scenes:** software/data structures and open research practice.

**Use case:** spatial proteomics.

# Cell organisation - regulation of protein localisation

**Spatial proteomics** is the systematic study of protein localisations.

# Spatial proteomics - Why?

## Localisation is function

- ▶ The cellular sub-division allows cells to establish a range of distinct micro-environments, each favouring different biochemical reactions and interactions and, therefore, allowing each compartment to fulfil a particular functional role.
- ▶ Localisation and sequestration of proteins within sub-cellular niches is a fundamental mechanism for the post-translational regulation of protein function.

## Re-localisation in

- ▶ **Differentiation** stem cells.
- ▶ **Activation** of biological processes.

# Spatial proteomics - Why?

## Mis-localisation

Disruption of the targeting/trafficking process alters proper sub-cellular localisation, which in turn perturb the cellular functions of the proteins.

- ▶ Abnormal protein localisation leading to the **loss of functional** effects in diseases ([Laurila and Vihinen, 2009](#)).
- ▶ Disruption of the nuclear/cytoplasmic transport (nuclear pores) have been detected in many types of **carcinoma cells** ([Kau et al., 2004](#)).
- ▶ Sub-cellular localisation of MC4R with ADCY3 at neuronal primary cilia underlies a common pathway for genetic predisposition to **obesity** ([Siljee et al., 2018](#)).

# Spatial proteomics - How, experimentally

## Abstract

Analysis of the spatial sub-cellular distribution of proteins is of vital importance to fully understand context specific protein function. Some proteins can be found with a single location within a cell, but up to half of proteins may reside in multiple locations, can dynamically re-localise, or reside within an unknown functional compartment. These considerations lead to uncertainty in associating a protein to a single location. Currently, mass spectrometry (MS) based spatial proteomics relies on supervised machine learning algorithms to assign proteins to sub-cellular locations based on common gradient profiles. However, such methods fail to quantify uncertainty associated with sub-cellular class assignment. Here we reformulate the framework on which we perform statistical analysis. We propose a Bayesian generative classifier based on Gaussian mixture models to assign proteins probabilistically to sub-cellular niches, thus proteins have a probability distribution over sub-cellular locations, with Bayesian computation performed using the expectation-maximisation (EM) algorithm, as well as Markov-chain Monte-Carlo (MCMC). Our methodology allows proteome-wide uncertainty quantification, thus adding a further layer to the analysis of spatial proteomics.

Our framework is flexible, allowing many different systems to be analysed and reveals new modelling opportunities for spatial proteomics. We find our methods perform competitively with current state-of-the-art machine learning methods, whilst simultaneously providing

# A Bayesian Mixture Modelling Approach For Spatial Proteomics

- ▶ *T Augmented Gaussian Mixture model (TAGM)* is a **multivariate Gaussian generative model** for MS-based spatial proteomics data. It posits that each annotated sub-cellular niche can be modelled by a multivariate Gaussian distribution.

# A Bayesian Mixture Modelling Approach For Spatial Proteomics

- ▶ *T Augmented Gaussian Mixture model (TAGM)* is a **multivariate Gaussian generative model** for MS-based spatial proteomics data. It posits that each annotated sub-cellular niche can be modelled by a multivariate Gaussian distribution.
- ▶ With the prior knowledge that many proteins are not captured by known sub-cellular niches, we augment our model with an **outlier component**. Outliers are often dispersed and thus this additional component is described by a heavy-tailed distribution: the multivariate Student's t-distribution, leading us to a *T Augmented Gaussian Mixture model*.

# A Bayesian Mixture Modelling Approach For Spatial Proteomics

- ▶ *T Augmented Gaussian Mixture model (TAGM)* is a **multivariate Gaussian generative model** for MS-based spatial proteomics data. It posits that each annotated sub-cellular niche can be modelled by a multivariate Gaussian distribution.
- ▶ With the prior knowledge that many proteins are not captured by known sub-cellular niches, we augment our model with an **outlier component**. Outliers are often dispersed and thus this additional component is described by a heavy-tailed distribution: the multivariate Student's t-distribution, leading us to a *T Augmented Gaussian Mixture model*.
- ▶ This methodology allows proteome-wide **uncertainty quantification**, thus adding a further layer to the analysis of spatial proteomics.

We initially model the distribution of profiles associated with proteins that localise to the  $k$ -th component as multivariate normal with mean vector  $\boldsymbol{\mu}_k$  and covariance matrix  $\boldsymbol{\Sigma}_k$ , so that:

$$\mathbf{x}_i | z_i = k \quad \sim \mathcal{N}(\boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \quad (1)$$

We initially model the distribution of profiles associated with proteins that localise to the  $k$ -th component as multivariate normal with mean vector  $\boldsymbol{\mu}_k$  and covariance matrix  $\boldsymbol{\Sigma}_k$ , so that:

$$\mathbf{x}_i | z_i = k \quad \sim \mathcal{N}(\boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \quad (1)$$

We extend it by introducing an additional *outlier component*. To do this, we augment our model by introducing a further indicator latent variable  $\phi$ . Each protein  $\mathbf{x}_i$  is now described by an additional variable  $\phi_i$ , with  $\phi_i = 1$  indicating that protein  $\mathbf{x}_i$  belongs to a organelle derived component and  $\phi_i = 0$  indicating that protein  $\mathbf{x}_i$  is not well described by these known components. This outlier component is modelled as a multivariate T distribution with degrees of freedom  $\kappa$ , mean vector  $\mathbf{M}$ , and scale matrix  $V$ .

$$\mathbf{x}_i | z_i = k, \phi_i \quad \sim \mathcal{N}(\boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)^{\phi_i} \mathcal{T}(\kappa, \mathbf{M}, V)^{1-\phi_i} \quad (2)$$

**Figure:** Illustration of how the TAGM model describes the pluripotent mouse embryonic stem cell data. Each ellipse contains a proportion of total probability of a particular multivariate Gaussian density. The outer ellipse contains 99% of the total probability whilst the middle and inner ellipses contain 95% and 90% of the probability respectively.

**Figure:** Assignment of proteins of *unknown* location to one of the annotated classes. The dots are scaled according to the protein assignment probabilities.

**Figure:** Exportin 5 (Q924C1) forms part of the micro-RNA export machinery, transporting miRNA from the nucleus to the cytoplasm for further processing. It then translocates back through the nuclear pore complex to return to the nucleus to mediate further transport between nucleus and cytoplasm. The model correctly infers that it most likely localises to the cytosol but there is some uncertainty with this assignment. This uncertainty is reflected in possible assignment of Exportin 5 to the nucleus non-chromatin and reflects the multi-location of the protein.

# Open research: open source software

The screenshot shows the GitHub repository for **lgatto / pRoloc**. The repository description is "A unifying bioinformatics framework for organelle proteomics" with a link to <http://lgatto.github.io/pRoloc/>. It has 2,051 commits, 10 branches, 25 releases, 1 environment, and 14 contributors. The repository includes a file tree with folders like `R`, `data`, `inst`, `man`, `src`, `tests`, `vignettes`, and files like `_Rbuildignore`, `.editorconfig`, `gitignore`, `travis.yml`, `CONDUCT.md`, `DESCRIPTION`, `NAMESPACE`, `NEWS`, and `NEWS.md`. Each file has a commit message and a timestamp.

The screenshot shows the Bioconductor website for the **pRoloc** package. The Bioconductor logo is at the top left, and navigation links for Home, Install, and Help are at the top right. The main heading is "Home - Bioconductor 3.8 - Software Packages - pRoloc". Below this is the pRoloc logo and a summary of the package: "A unifying bioinformatics framework for spatial proteomics". It shows statistics: platforms (all), forks (254 / 164), posts (1 / 2 / 2 / 0), and in BiOC (6 years). The DOI is [10.18129/B9.bioc.pRoloc](https://doi.org/10.18129/B9.bioc.pRoloc). The Bioconductor version is Release (3.8). The description states: "The pRoloc package implements machine learning and visualisation methods for the analysis and interrogation of quantitative mass spectrometry data to reliably infer protein sub-cellular localisation." The author is Laurent Gatto, Oliver Crook and Luca M. Breckels. The citation is: "Gatto L, Breckels LM, Wiecek S, Burger T, Lilley KS (2014). 'Mass-spectrometry based spatial proteomics data analysis using pRoloc and pRolocdata.' *Bioinformatics*." The repository link is <https://github.com/lgatto/pRoloc>.

**Middle Screenshot (bioRxiv):** Shows the preprint page for "Assessing sub-cellular resolution in spatial proteomics experiments" by Laurent Gatto, Lisa M. Breckels, and Kathryn S. Lilley. The DOI is <https://doi.org/10.1101/377630>. It is published in *Current Opinion in Chemical Biology* (doi: 10.1016/j.cbpa.2018.11.015).

**Right Screenshot (ScienceDirect):** Shows the published paper in *Current Opinion in Chemical Biology*, Volume 48, February 2019, Pages 123-149. The title is "Assessing sub-cellular resolution in spatial proteomics experiments" by Laurent Gatto<sup>1,2,3,4</sup>, Lisa M. Breckels<sup>5,7</sup>, and Kathryn S. Lilley<sup>2</sup>. The abstract states: "The sub-cellular localisation of a protein is vital in defining its function, and a protein's mis-localisation is known to lead to adverse effect. As a result, numerous experimental techniques and datasets have been published, with the aim of deciphering the localisation of proteins at various scales and resolutions, including high profile mass spectrometry-based efforts. Here, we present a meta-analysis assessing and comparing the sub-cellular resolution of 29 such mass spectrometry-based spatial proteomics experiments using a newly developed tool termed QSep. Our goal is to provide a simple quantitative report of how well spatial proteomics resolve the sub-cellular niches they describe to inform and guide developers and users of such methods."

Figure: Gatto et al. (2018) reproducible document  
(<https://github.com/lgatto/QSep-manuscript>), preprint  
(<https://doi.org/10.1101/377630>) and paper  
(<https://doi.org/10.1016/j.cbpa.2018.11.015>).

Working with open and reproducible research in mind doesn't mean releasing everything prematurely, it means

- ▶ managing research in a way one can find data and results at every stage
- ▶ one can reproduce results, re-run/compare them with new data or different methods/parameters, and
- ▶ one can release data (or parts thereof) when/if appropriate.

# Conclusions

- ▶ Protein sub-cellular localisation: technologies (hyperLOPIT) and opportunities.
- ▶ Reliance on computational biology, statistics and dedicated software (pRoLoc *et al.*) to interpret data and acquire biological knowledge.
- ▶ Rigorous computational infrastructure and sound data analysis and interpretation is a **long term investment**.
